

From zero to hero

Infrastructure as Code

Daniel Hasselwander

ti&m

Goals for this session

1. Understand what is terraform and where it work
2. Understand how terraform works
3. Understand how terraform provide it's functionality

What is terraform ?

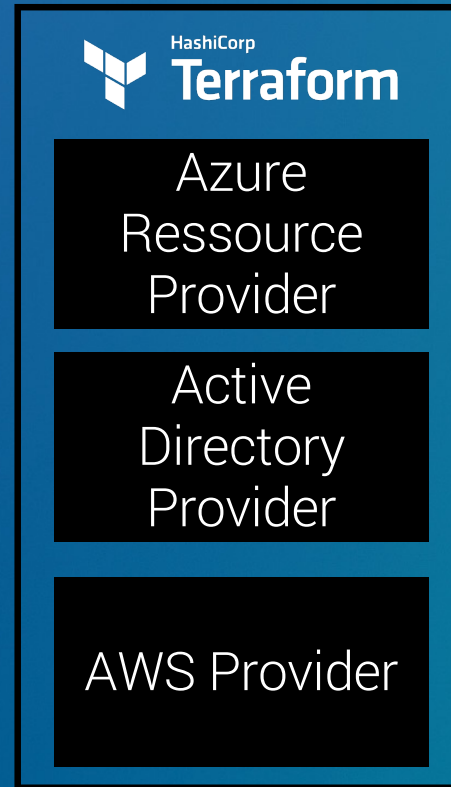

- Declarative IaC Tool
- Works with several targets
- Works native on the client like powershell
- Open Source
- From HashiCorp
- IaC Files will be written in HCL

How it works / Easy Abstraction

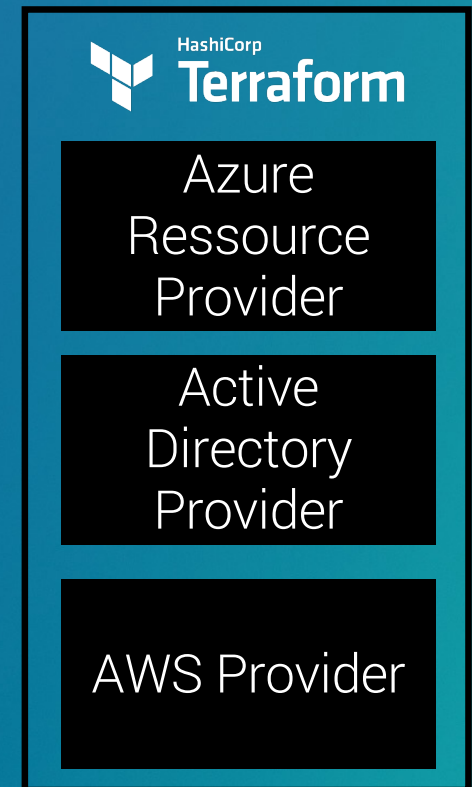

How it interacts with targets / Provider

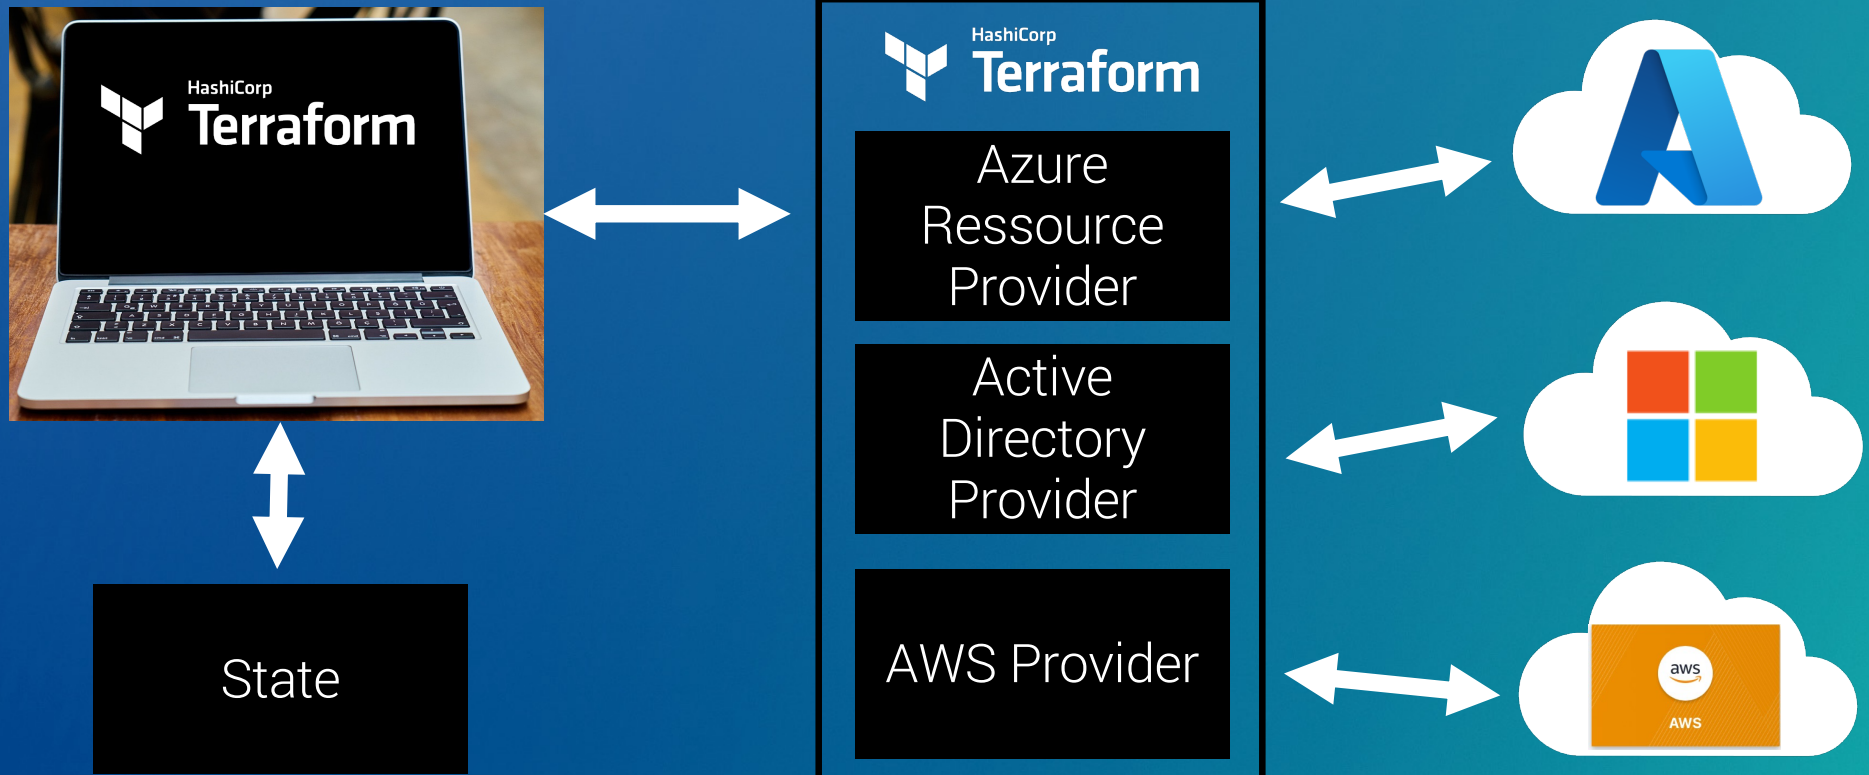

Provider

- Must be installed
- Works like a extension
- Provide the functionality
- Developed from several organization

How it knows what is deployed / State

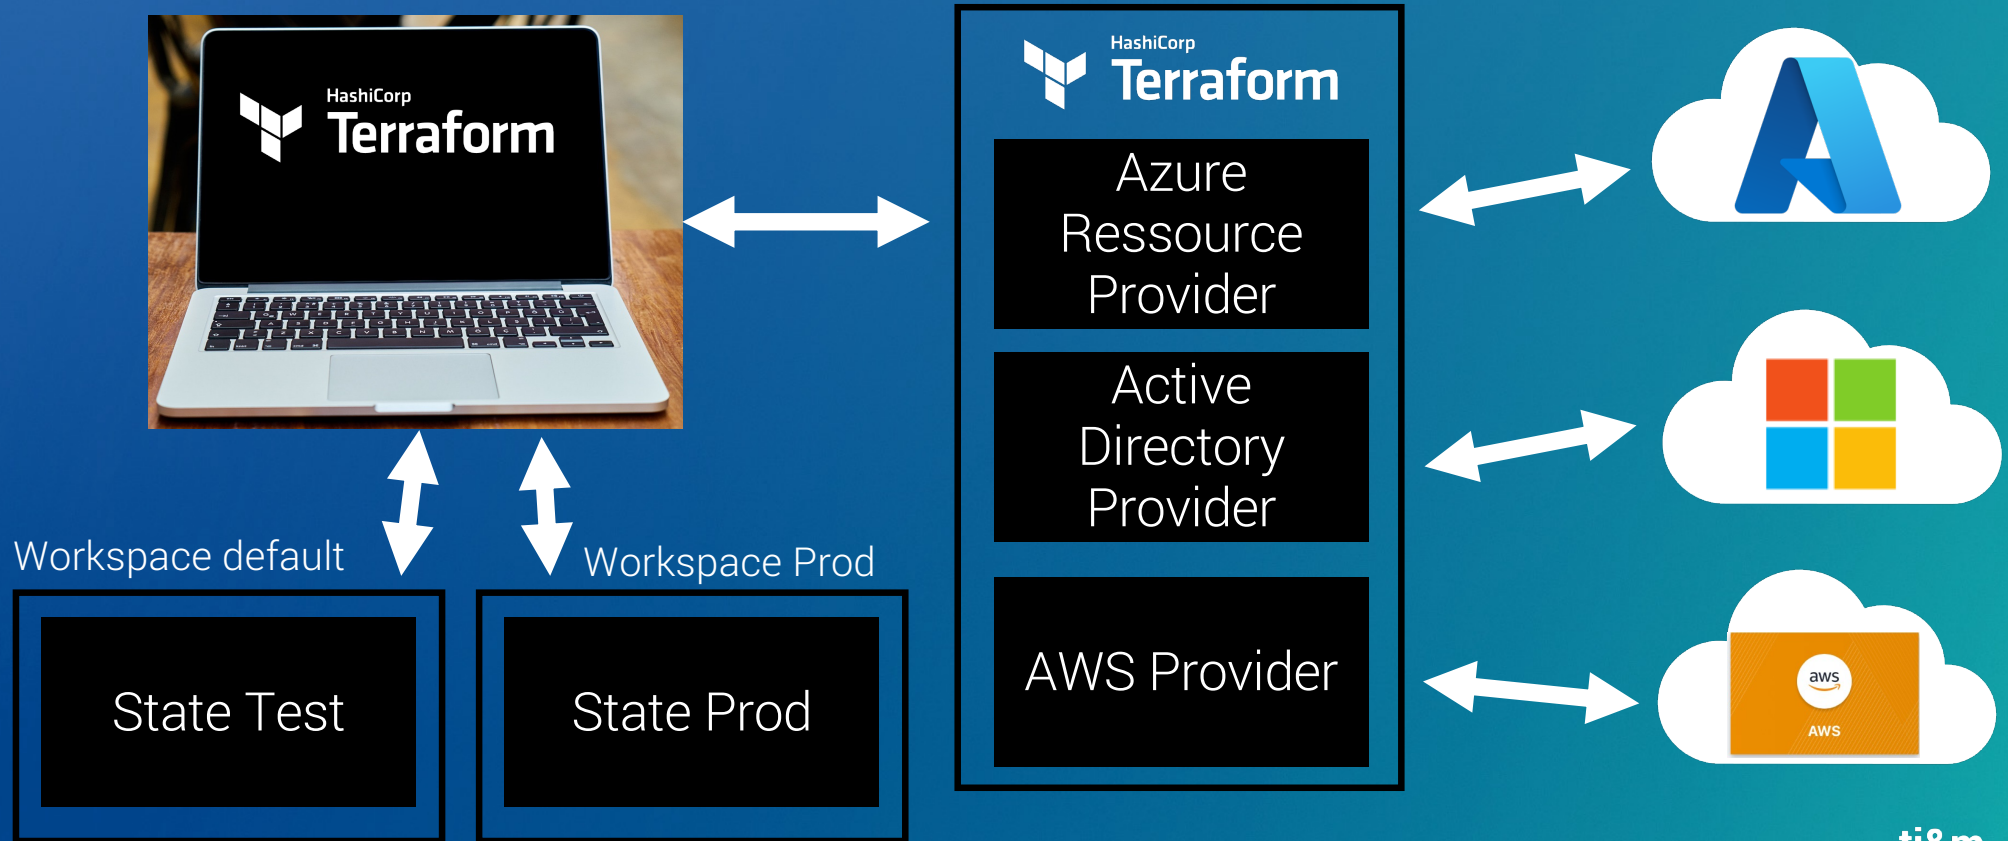

State

- Can be store local or remote
- Can be read from people
- Looks like JSON
- List of deployed resources from terraform

State

Manage several env / Workspace

Workspace

- Set the state which will be compared

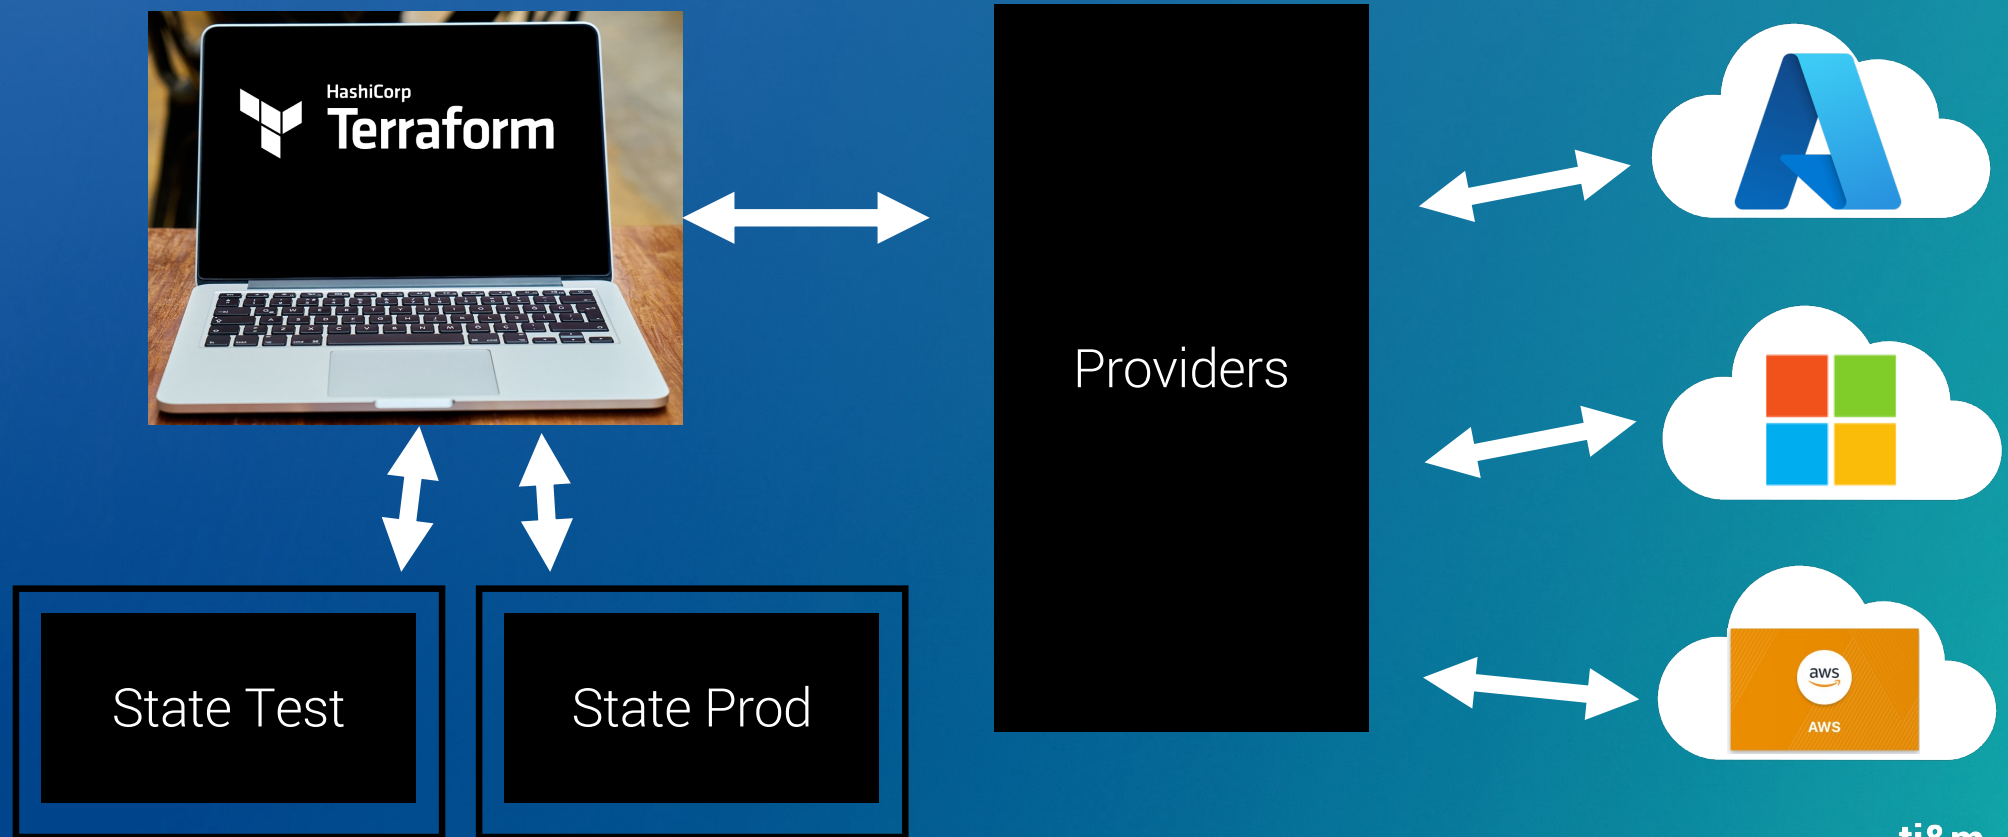

State Test

State Prod

And what does terraform itself?

- Compare the actual state in your infrastructure with saved state
- Creates a dependency graph for changes
- Plan the change actions

Manage several env / Workspace

How it works

How it works / init

- Install providers
- Saved the installed version from provider in a lock file
- Initialize a working directory from terraform itself
- Must be executed after a provider change

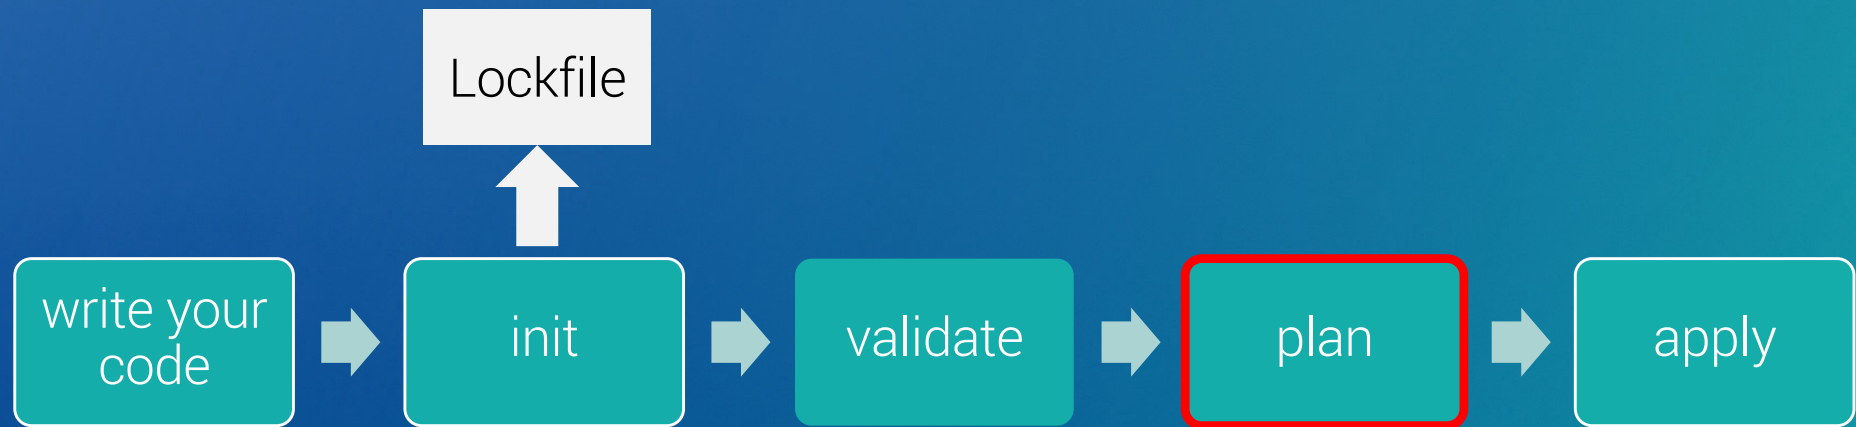

How it works

How it works / validate

- Check your written files if it's executable

How it works

How it works / plan

- Use your provider to get actual state of the infrastructure
- Compare it with your saved state
- Recognize changes
- Build a dependency graph for the changes that it must be do
- Write a execution plan for the changes

How it works

How it works / apply

- Execute the produced execution plan
- Can produce errors as results of the real api
- Save the new state

We digitalize your company.

5-10 Minutes

Go in teams of 2 people each and make a short description of the functionality of terraform
